Supplement of

Community-specific hydraulic conductance potential of soil water decomposed for two Alpine grasslands by small-scale lysimetry

Community specific hydraulic conductance potential of soil water decomposed for two Alpine grasslands by small-scale lysimetry

Supplement S1: Biomass development in the 12 lysimeters (each panel represents one lysimeter, 3 x REG-treatment for the M- and S-type, 3 x D-treatment for the M- and 7 S-type) based on different non-destructive biomass estimation methods.
The following parameters were used for the biomass estimation: maximum canopy height (DW.hmax), average canopy height (DW.havg), projected area (DW.projA), pinpoint data referenced to all functional groups (DW.pint) and to single functional groups (DW.pinf). Additionally, the following parameter combinations were employed to improve the estimation: pinpoint and maximum canopy height (DW.pinh), canopy height and projected area (DW.pini), canopy height and projected area (DW.htpi), pinpoint, canopy height and projected area (DW.htpapi). Destructively measured biomass at cutting dates is also shown (DW.cut).
